

## **Case Study #2 Pizza Runner**

Bonus Question: If Danny wants to expand his range of pizzas - how would this impact the existing data design? Write an INSERT statement to demonstrate what would happen if a new Supreme pizza with all the toppings was added to the Pizza Runner menu?

If Danny wanted to expand his range of pizzas, there would be two tables that would be changed. The pizza name and recipes would have to be altered. We would just have to insert a new row incrementing the pizza\_id by 1 every time Danny wants to offer a new pizza and insert the standard set of toppings for that said pizza recipe in the pizza\_recipe table and insert the name of that pizza in the pizza\_name table.
